

CORRECTIONExercice 1

$$f(x) = \sin(2x + \pi)$$

Or $\sin(x + \pi) = -\sin x$ donc $\sin(2x + \pi) = -\sin 2x$

$$\text{Donc } f(x) = \sin(2x + \pi) = [-2 \sin x \cos x]$$

Exercice 2

$$\begin{aligned} f'(x) &= -\sin x \times \sin 2x + \cos x \times 2 \cos 2x - 2 \cos x \\ &= -\sin x \times 2 \sin x \cos x + \cos x \times 2 (2 \cos^2 x - 1) - 2 \cos x \\ &= -2 \sin^2 x \cos x + 2 \cos^3 x + 4 \cos^3 x - 4 \cos x \\ &= -2(1 - \cos^2 x) \cos x + 4 \cos^3 x - 4 \cos x \\ &= 6 \cos^3 x - 6 \cos x \\ &= 6 \cos x (\cos^2 x - 1) \\ &= [6 \cos x (\cos x - 1)(\cos x + 1)] \end{aligned}$$

Exercice 3

$$f(x) = 2 \sin^2 x + 4 \sin x + 2$$

On pose $X = \sin x$

$$\text{Soit } f(x) = 2X^2 + 4X + 2$$

$$\text{On résout } 2X^2 + 4X + 2 = 0$$

$\Delta = 0$ donc l'équation $2X^2 + 4X + 2 = 0$ admet une unique solution $x_0 = -1$

$$X = \sin x, \text{ d'où } \sin x = -1 \Leftrightarrow x = -\frac{\pi}{2} + 2k\pi$$

Exercice 4

$$1) -1 \leq \cos x \leq 1$$

$$\Leftrightarrow -1 \leq \cos(2x + \frac{\pi}{2}) \leq 1 \Leftrightarrow -1 \times 3 \leq 3 \times \cos(2x + \frac{\pi}{2}) \leq 1 \times 3$$

$$\Leftrightarrow [-3 \leq f(x) \leq 3]$$

$$2) f(-x) = 3 \cos(-2x + \frac{\pi}{2})$$

Or $\cos x = \cos(-x)$

$$\text{Donc } f(-x) = 3 \cos(2x + \frac{\pi}{2}) = f(x)$$

La fonction f est donc paire.

$$\begin{aligned} 3) f(x + \pi) &= 3 \cos(-2(x + \pi) + \frac{\pi}{2}) = 3 \cos(-2x - 2\pi + \frac{\pi}{2}) \\ &= 3 \cos(-2x + \frac{\pi}{2}) = f(x). \end{aligned}$$

$$4) f'(x) = 3 \times 2 \times (-\sin(2x + \frac{\pi}{2})) = -6 \sin(2x + \frac{\pi}{2})$$

$$\begin{aligned} 5) \text{ a)b) Si } -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}, \text{ alors } -\frac{\pi}{2} \leq 2x \leq \frac{\pi}{2} \Leftrightarrow 0 \leq 2x + \frac{\pi}{2} \leq \pi \\ \Leftrightarrow 0 \leq \sin(2x + \frac{\pi}{2}) \Leftrightarrow -6 \sin(2x + \frac{\pi}{2}) \leq 0 \Leftrightarrow f'(x) \leq 0 \end{aligned}$$

$$\begin{aligned} \text{Si } \frac{\pi}{4} \leq x \leq \frac{3\pi}{4}, \text{ alors } \frac{\pi}{2} \leq 2x \leq \frac{3\pi}{2} \Leftrightarrow \pi \leq 2x + \frac{\pi}{2} \leq 2\pi \\ \Leftrightarrow 0 \leq \sin(2x + \frac{\pi}{2}) \Leftrightarrow -6 \sin(2x + \frac{\pi}{2}) \geq 0 \Leftrightarrow f'(x) \geq 0 \end{aligned}$$

c)

x	$-\frac{\pi}{4}$	$\frac{\pi}{4}$	$\frac{3\pi}{4}$
$f'(x)$	-	()	+
f	0	-3	3

$$6) y = f'(\frac{\pi}{4})(x - \frac{\pi}{4}) + f(\frac{\pi}{4}) \Leftrightarrow [y = -3]$$
